Competitive landscape and product position

Human API · 26 October 2026 · synthetic concept analysis

1 · Executive view

Many products already find company files, summarize them, show sources and respect file permissions. Human API should not be presented as a new search engine. Microsoft's Autopilot and SharePoint knowledge announcements also overlap with the broad idea of helping work continue when a colleague is away.

Example: Alice asks why a project setting changed. Bob has allowed questions about that topic for a limited time. The app shows a source Alice can open and explains what the source does not answer; if the current value is unclear, it sends the question to Carla. Whether teams need this extra workflow is still unproven.

Recommendation: try the workflow inside Teams or Copilot Studio, reuse Microsoft 365 search and file permissions, and do not build another general enterprise search product.

2 · Capability matrix

What it can do	Human API demo	Microsoft tools	Glean / Moveworks
Find answers and show sources	Word matching on fictional files	Copilot and SharePoint knowledge features	Search and cited answers described
Check who can open each file	Checks requester before search	Uses Microsoft file permissions	Uses connected-app permissions
Run a background agent	No	Autopilot announced; preview status varies	Agents and workflows available
Owner approval and response timer	Demonstrated locally	Can be configured; exact same flow not established	Exact same flow not established
Bring in a human	Named owner or backup	Human assistance in Copilot Studio	Smart handoff / workflow features
Approve a correction before reuse	Demonstrated locally	Could be modeled; exact same flow not established	Exact same flow not established
Public comparable pricing	None	License/capacity/usage terms	Quote required

3 · Evidence by platform

Microsoft

Microsoft's 25 Sep 2026 announcement describes Autopilot (formerly Scout) as a persistent, proactive personal agent; the announcement says private preview is expanding at month end. Microsoft announced a Copilot-curated team knowledge base in SharePoint Frontier Preview on 14 Oct, and began Copilot in SharePoint's general-availability rollout on 30 Sep. SharePoint agents use source permissions. Copilot Studio supports a human assistance node. These products overlap with work that continues in the background, but the reviewed public pages do not establish the exact owner-approved question and response-timer flow shown in this demo.

Glean

Glean describes cross-app search constrained by existing permissions, grounded answers with citations, people discovery, agent workflows and use in work surfaces. Its public materials overlap heavily with enterprise knowledge search and agent building.

Moveworks

Moveworks documents multi-source search and summarization, source references, conversational Teams/Slack/Google Chat experiences, action plugins and Smart Handoff. Its docs say feedback does not automatically alter assistant behavior and plugin selection cannot be guaranteed by a hard rule.

4 · Licensing and sources

- M365 Copilot requires eligible license plans; agentic features may use consumption-based billing.
- Copilot Studio requires authorized user/tenant setup and capacity or usage-based billing according to tenant configuration.
- SharePoint agents have applicable access/licensing and tenant governance requirements.
- Teams apps require app registration, tenant custom app upload/sideloading and public HTTPS endpoint; Graph delegated permissions need consent.
- Comparable Glean/Moveworks pricing was not found in reviewed public technical material; obtain vendor quotes.
