FUTURE OF WORK @ PRESIGHT

Human API

Help answer work questions when the expert is away

A cited answer when the evidence is clear. A person when it is not.

EUREKA INNOVATION HACKATHON · EARLY CONCEPT

LOCAL DEMO · FICTIONAL DATA

Work can stop at the person who knows

A question needs context, but the right person or file is hard to find.

01

A decision is needed

An engineer needs to understand a service change.

02

The expert is away

The person who remembers the reason is unavailable.

03

Files are scattered

A decision note or operating guide may hold the answer.

04

Work waits or interrupts

Someone waits or interrupts another expert.

A problem to test—not a Presight measurement

Measure search time. Do not count waiting as saved work.

Background and sources: see the companion PowerPoint speaker notes.

Why did the service setting change?

Alice asks Bob about a fictional Project Alpha change.

ASKED BY ALICE

Why did the timeout change from 90 to 120 seconds? Is 120 seconds still needed?

Directed to Bob · DevOps / project owner
Synthetic out-of-office status

SOFTWARE ANSWER · PARTIAL

The decision note says the timeout rose because setup sometimes took longer than 90 seconds. The change was approved for release 5.2. The note does not say whether 120 seconds is still needed today.

SOURCE ADR-024 · written decision · version 1.0

This is not a reply written by Bob.

Background and sources: see the companion PowerPoint speaker notes.

What time might the idea save?

A planning example—not a measured Presight figure.

50,000

possible work questions each year

500 employees × 2 questions/week × 50 weeks

Count search time

Time people spend finding and checking an answer.

Do not count waiting

Time spent waiting is not automatically saved work.

Measure real use

Count answers people accept and time a pilot can verify.

EXAMPLE ASSUMPTIONS · NOT MEASURED BENEFIT

Background and sources: see the companion PowerPoint speaker notes.

Owner consent does not give file access

Two separate checks protect the person asking and the person sharing knowledge.

The owner agrees

Choose dates, project, topic, coworkers, files and backup. Pause or stop any time.

The asker has access

Use only files the requester is already allowed to open.

Answer or get help

Show the source and limits. Deny restricted requests. Ask a human when evidence is weak.

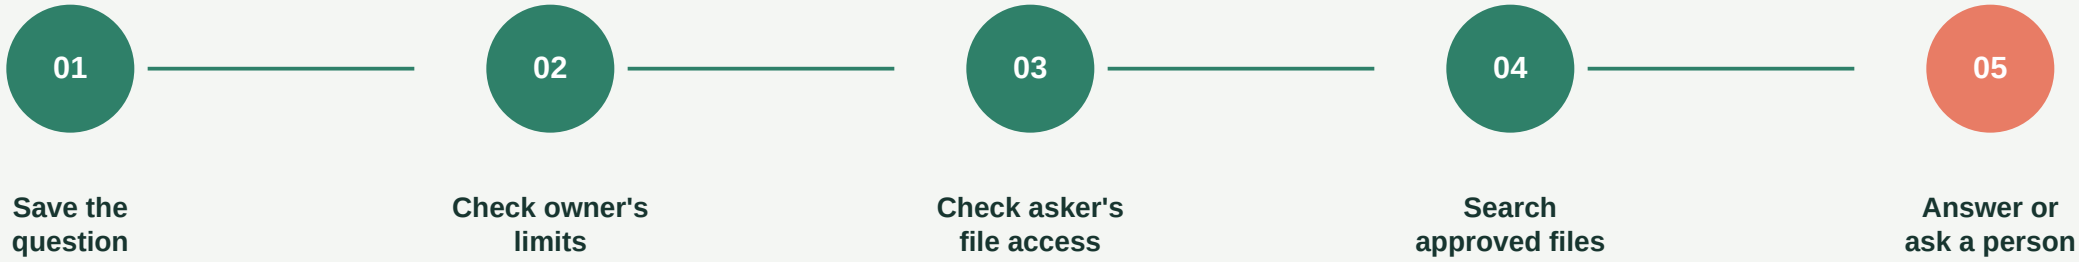

Every answer shows

Who wrote it / source / what is unknown / who can help next

Background and sources: see the companion PowerPoint speaker notes.

One question, five clear steps

The app records what happened and checks file access before searching.

A source supports the answer

Show the file, version and known limits

No proof, restricted or conflict

Give a safe denial or ask an approved person

Background and sources: see the companion PowerPoint speaker notes.

What Bob has agreed to

The owner can pause or stop the helper at any time.

DATES

20 Oct – 02 Nov

PROJECT

Project Alpha

QUESTION TOPICS

Deployment · timeout

WHO MAY ASK

Approved project colleagues

FILES TO CHECK

Selected decision notes / guides

BACKUP PERSON

Carla Mendez

OWNER CONTROL

Pause or stop

A manager reviews changes. Being Busy or away never counts as permission.

Every change is recorded.

Background and sources: see the companion PowerPoint speaker notes.

Where a Microsoft connection could fit

These connections are not part of the tested local demo.

Work sign-in

Check who is signed in with a Microsoft work account. Early code only; needs tenant testing.

NOT CONNECTED

SharePoint files

Search and open files as Alice, using Alice's existing access. Adapter not tenant-tested.

NOT TENANT TESTED

Out-of-office status

Possible future check of owner's status and dates only. No inbox or message text.

EARLY ADAPTER

Teams

No bot yet. A future app needs registration, a secure web address and tenant approval.

FUTURE WORK

Future file search must use the requester's own Microsoft permissions.

Background and sources: see the companion PowerPoint speaker notes.

The requester keeps control of file access

The owner's permission never unlocks files for another person.

Who is asking?

Work identity · project
question · deadline

What did owner allow?

Dates · topic
people · files

Can asker open file?

Project access
file permissions

Does source answer?

Approved file
missing · conflict

What happens next?

Show source
deny · ask human

If access is denied

Give no file name, content or clue that it exists.

Audit trail

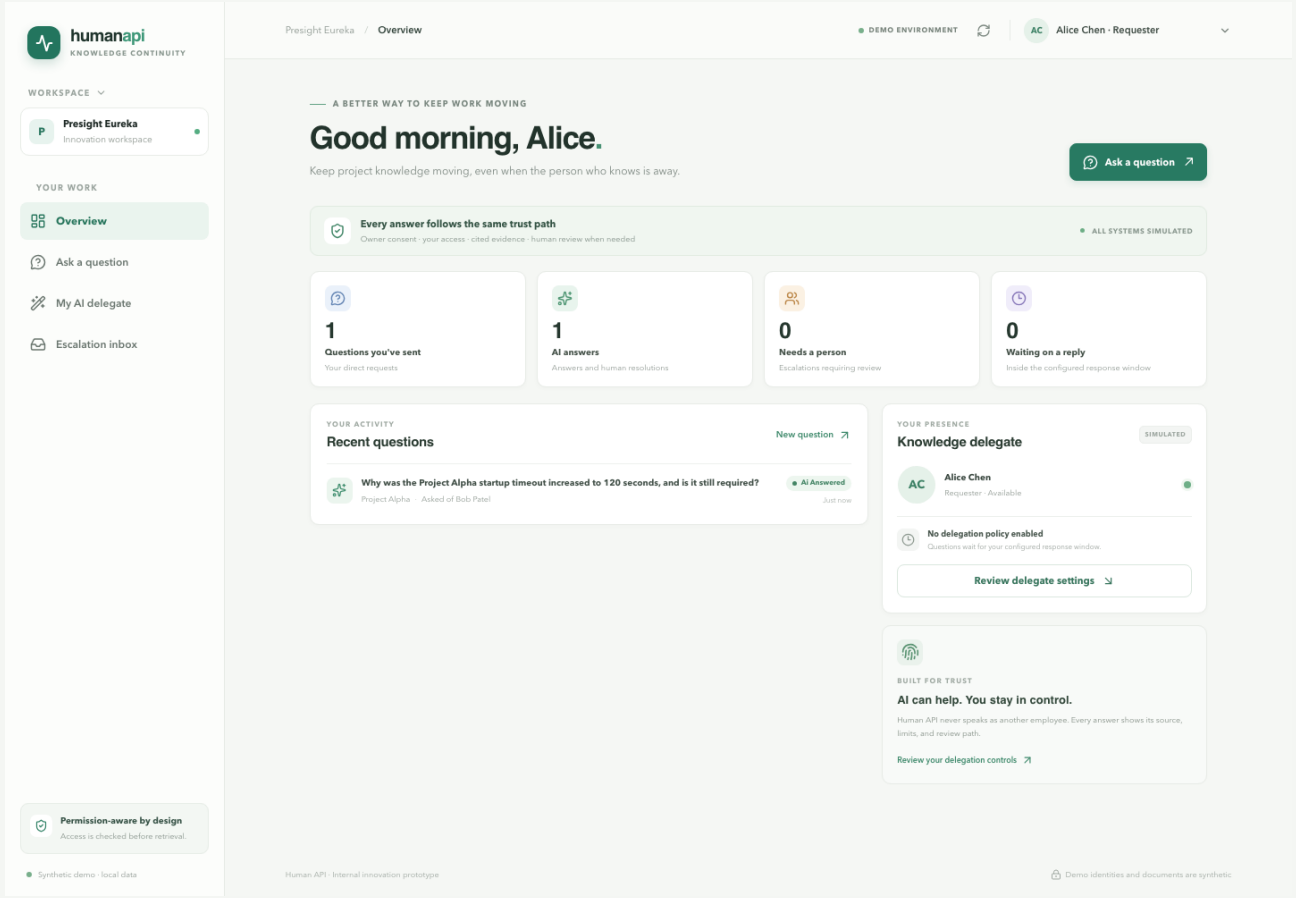

Record the owner's choice, file check, source and result.

Not built for production yet: encrypted storage, deletion controls, real file labels, multi-server safety or independent review.

Background and sources: see the companion PowerPoint speaker notes.

A real local app with fictional data

Question records and approval steps work; all people and files are examples.

The question is saved

See its status, response deadline and history.

The answer shows its source

The decision note explains the change, not whether it is still needed.

A person handles gaps

Unclear answers go to a human; reuse needs approval.

FICTIONAL DATA · NO LIVE MICROSOFT OR AI MODEL

Background and sources: see the companion PowerPoint speaker notes.

AI may explain evidence; people and rules keep control

The demo uses no language model. A future AI must never decide who may see a file.

SOFTWARE RULES

Verify identity
Check owner approval
Check file access
Honor revocation

POSSIBLE FUTURE AI

Summarize allowed files
Draft a cited answer
Say what is unknown

PEOPLE DECIDE

Resolve uncertainty
Approve corrections
Change or stop policy

The current demo follows a small set of steps. Add more AI only if a pilot shows it helps.

Background and sources: see the companion PowerPoint speaker notes.

Search is common. The workflow is the question.

Microsoft and other tools already find files, show sources and respect file permissions.

Tools already do

Search company files, summarize them, show sources and follow file permissions.

Workflow to test

Owner opts in. Set a response time. Keep the requester's file access. Ask a human when needed.

Open question

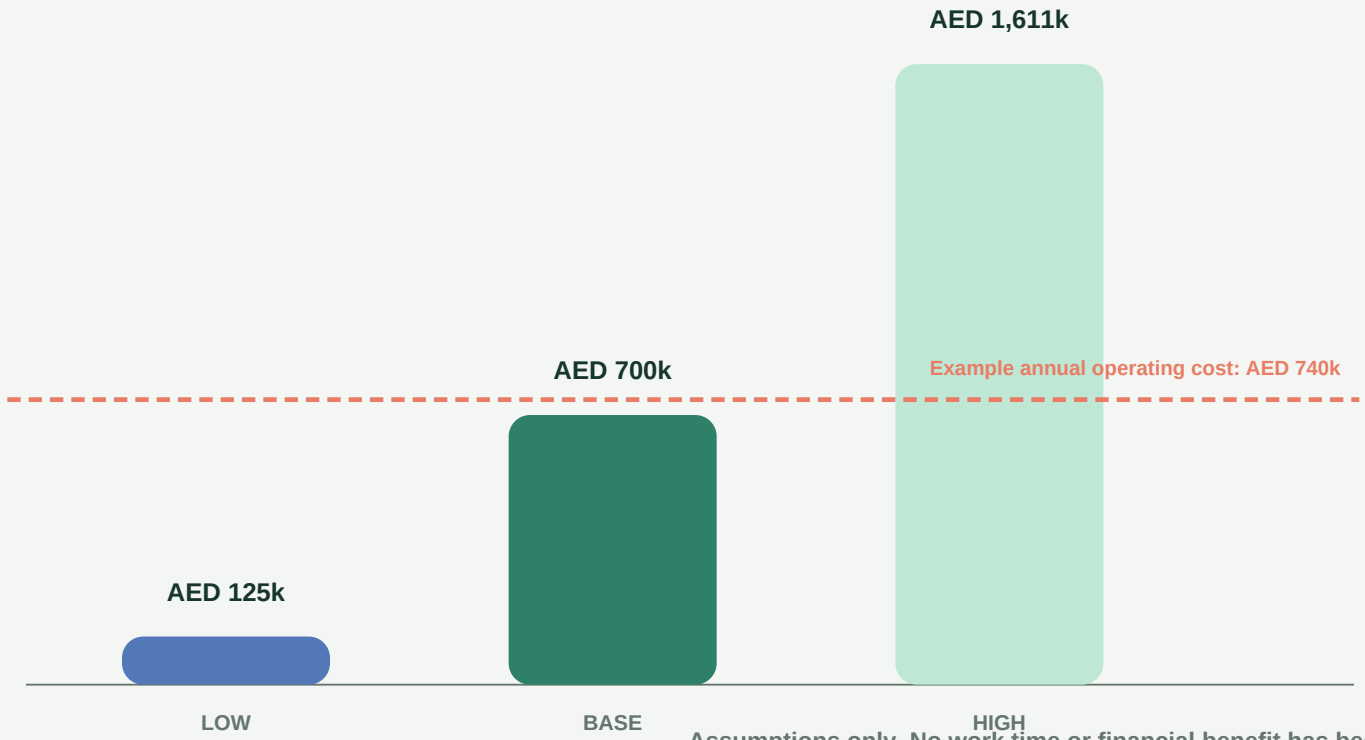

Do teams need this extra handoff, or can existing tools do the job?

No public review proves this exact workflow is unique.

Sources and limitations: see the companion PowerPoint speaker notes.

Time value is not the same as cash saved

Compare estimated recovered work time with costs in AED (UAE dirhams).

BASE EXAMPLE · VALUE OF TIME

AED 700k

8,400 answers people accept
× 20 minutes of search saved
× AED 250 per work hour

Time value is AED 40k below example cost

Assumptions only. No work time or financial benefit has been measured.

Background and sources: see the companion PowerPoint speaker notes.

A path from demo to a safe pilot

Review security and file access. Then connect Microsoft. Then measure value.

NOW

Local demo

Fictional people and files
Rules and file-access checks
Answer or human handoff

Working

STEP 1

Safety review

Review file labels
Check owner permission
Agree on data handling

Needs review

STEP 2

Connect Microsoft

Work sign-in
Requester file access
Teams app

Needs tenant setup

STEP 3

Small pilot

One opt-in team
Low-risk files
Measure time and trust

6–10 weeks

No live Microsoft connection has been tested. No language model is used. This is not security-certified.

Background and sources: see the companion PowerPoint speaker notes.

PILOT PROPOSAL

Test the workflow with one willing team.

01	**One willing team**	Use existing, low-risk files
02	**6–10 weeks**	Review security and connect Microsoft
03	**Safety first**	Stop if anyone sees a file they should not
04	**Measure value**	Search time saved, accepted answers, cost

The ask

Sponsor a security review, Microsoft setup and one pilot manager.

Human API · Show sources, limits and a human path when the answer is not there.
